

# ARIS User Guide & Disclaimer

# Disclaimer

BEFORE USE, YOU MUST READ THE LICENSE AND THE ENTIRE USER GUIDE BEFORE USING THE ARIS SOFTWARE APPLICATION.

## Telemetry:

There is absolutely no communication between this software and an external server unless manually configured by the user for their own purpose.

Everything in this software is entirely local.

There are no auto-updaters, background services, or network calls whatsoever.

The military does not endorse this software. It is purely voluntarily used.

This software is primarily designed for use by JROTC units or ROTC units to manage supply/inventory/armory, or other logistics.

# User Guide

FAQ:

Q: Do I have to install this program?

A: No, you do not have to install it as an app. Most schools, especially ChromeOS devices in general, are strict about the installation of apps. However, all computer devices typically support HTML files, which are Hypertext Markup Language files. All websites, some popular applications (like Visual Studio Code), and even ChromeOS itself heavily depend on this type of file.

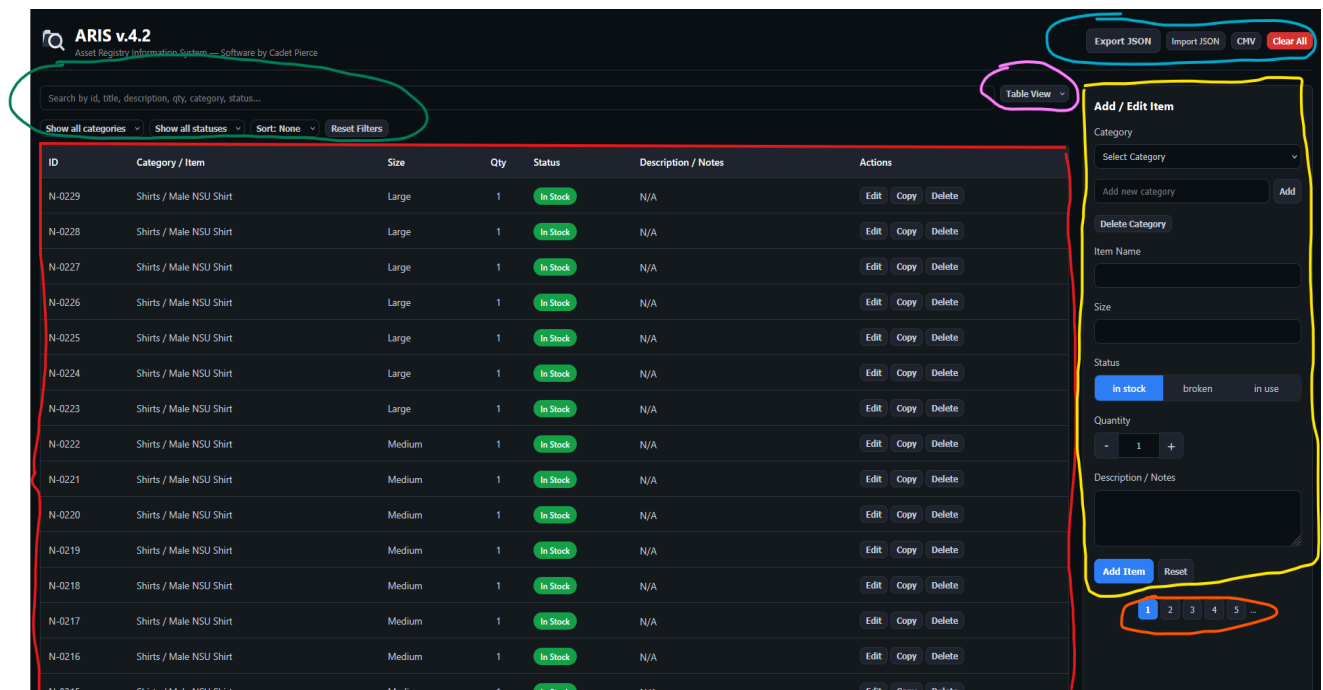

Q: But if it's built like a website, won't my school block it?

A: No, because it is locally hosted and a file downloaded on your computer. Just like downloading a JPEG file and opening it on your computer, it works in the same sense.

Q: Once I download the app, if it's an HTML file I just download and open from my file explorer into my browser, how do I open it every time I use it?

A: Bookmark the HTML file while it's open in your browser, or move the HTML file to a folder on your computer where you can find it.

## Basic UI Information:

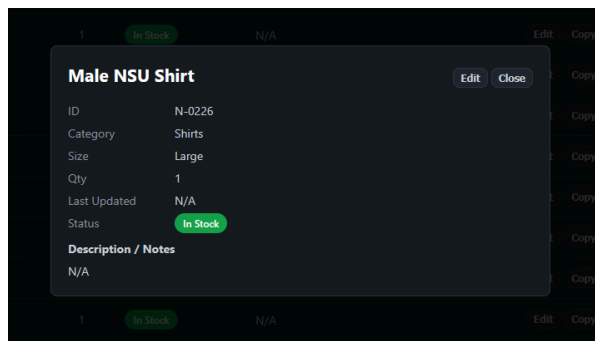

### GREEN:

The section outlined in green is your search and finding menu. You can search by almost every identifiable piece of information on an entry. This includes size, ID, title, keywords in the descriptions, statuses, categories, and other relevant details. If you are not searching for a specific item, you may also use the filter options. You can click the dropdown menu buttons to view and select which items are displayed by filtering through categories, statuses, quantity (highest to lowest), or A-Z/Z-A.

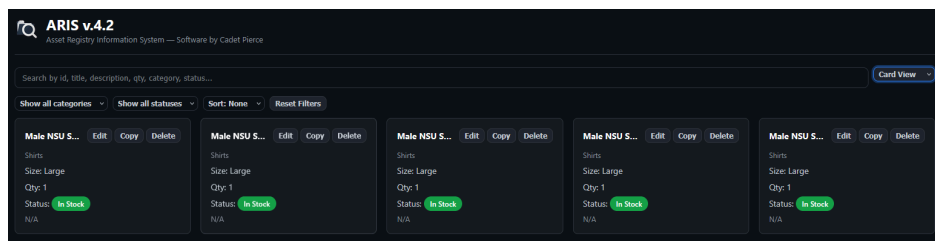

### RED:

The section outlined in red is your data entry display center. This is where you can manage existing entries and view what you have already inputted. Here, you can double-click an item to view the focused view. The focused view looks like this:

The focused view is included because some descriptions or other long pieces of information inside an entry do not fit in the display dimensions of a table line or a

card. Also, you may view entries as cards or as a table. In the image above, with all the references and panels outlined, it is in table view mode. Switching to card view looks like this:

You can also edit, copy, or delete items from the entry table list. Pressing 'copy' will automatically duplicate an item you have already made with its exact information, except for the timestamps and the auto-generated ID number. This is so that, let's say, you have two male uniform dress shirts, both a size small. You can just copy a data entry of a male uniform dress shirt size small instead of having to create and re-enter all the same information as a new data entry. Pressing 'edit' on a data entry item will open that data entry and its information in the creation panel, edit as desired, and then press Save at the bottom, where the Add Item button would typically appear. If you wish to remove an item, press the delete button on the item. It will open up a menu prompting you if you are sure you'd like to remove the specified data entry. If yes, press the red 'delete' button.

Note: If an item is marked as in stock, it will appear in green. If an item is marked as broken, it will appear in red. If an item is marked as in use, it will be marked in yellow.

PINK:

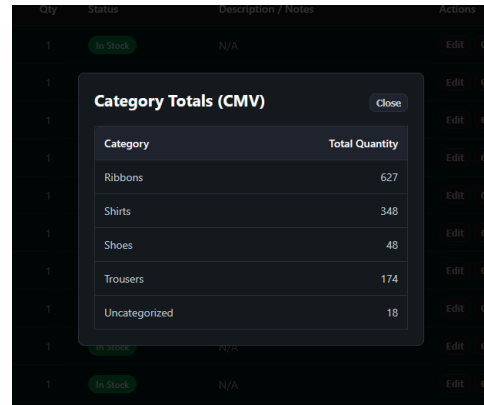

The section outlined in pink is just a small drop-down menu where you can select if the data entries are displayed in card form or table form.

ORANGE:

The section highlighted in orange is the data entry display menu. When opening the application, it will only show 50 data entries per 'tab.' This is because HTML files open up in your web browser, such as Google Chrome, Chromium, Firefox, Microsoft Edge, Opera, Opera GX, Brave, Libre Wolf, Tor, or any other browser that you use and if you had thousands of data entries added, it could cause the page to load slowly or crash upon opening if it tried to display all entries at once. So press the menu that has the numbers of tabs to display the next 50 entries. Also, if you search or apply display filters, the tab numbers will adapt, showing only pages of matching results.

BLUE:

The section outlined in blue is the administration menu. The first option is Clear All. This is a button you can use if you want to clear the application of all data entries. It will remove all category profiles, items, and anything else that is not default from the software package. If you press this button, it will prompt for a password. The default password is always **“administratormasterpassword”**. Once you enter this password and press 'ok', it will revert everything inside the application to its default settings. The CMV button is the cumulative count button. When you press it, it will open up a pop-up window within the application,

The screenshot shows a dark-themed application interface with a table titled "Category Totals (CMV)". The table has two columns: "Category" and "Total Quantity". The data rows are as follows:

| Category      | Total Quantity |
|---------------|----------------|
| Ribbons       | 627            |
| Shirts        | 348            |
| Shoes         | 48             |
| Trousers      | 174            |
| Uncategorized | 18             |

displaying the total accounts of each category.

The other options are the Export/Import JSON buttons. These are required to be built into the software for multiple reasons. The application by default stores its data (anything you've entered into the application) inside your local browser's cache using the localStorage API of your browser. This means that if you cleared your cookies and cache on your browser, it would delete all the data you've entered. A JSON file is a JavaScript Object Notation file. It holds data that can be parsed and read into more complex systems while stored as plain text inside the file itself. In this case, it is used to store the data about what you've entered into the application. So let's say you entered your unit's entire supply inventory, but you want to clear your browser cache. You would press the button "Export JSON." This will trigger a download of a file to your computer named 'aris-v4-NUMBERSHERE.json.' This JSON file contains all the data you've entered, including categories, data entries, and any other information you've entered. Then you clear your browser cache, and when you open up your application again, all the data will have been cleared. To restore it, press the 'Import JSON' button at the top left corner of the screen. This will open up your file explorer on your computer. Select the JSON file that you exported earlier and open it. This will automatically restore all your data.

"But what if I have a JSON file of ARIS data I want to import to my application, but my application already has data on it? Do I have to clear it first to import the JSON?"

No, you can import existing ARIS JSON data files into programs with existing data. If you have duplicate auto-generated ID numbers, the system will automatically prevent duplicates and handle all the data specifics. Also, I recommend renaming

your exported ARIS JSON data files as the name of their topic and then the date. Example: ARMORY 10-14-24. This way, you can have multiple backups of your data stored and easily keep track of which versions are the newest/oldest.

#### YELLOW:

The section outlined in yellow is your data entry creation panel, where you add or edit your items and data entries. When creating and adding a new item to your data sets, the first thing you must do is select a category. If you do not, it will automatically be marked as an 'Uncategorized' item. If it's your first time using this application, you will need to add your own customized categories. To do this, click the section marked 'Add new category.' Type the name of the new category you want to create, like Shirts or Shoes, and click 'add.' Then click select category again, and choose your desired category for the item you will create. To delete a category, select a category from the top like normal and then click 'delete category.' After selecting a category or leaving it as uncategorized, you must name your item. Type in the desired name of the item you are going to create. The next field you need to fill out is the Size field. If you are adding something that doesn't have a size, such as pins, ribbons, or drill rifles, leave it blank. If it is something that does have a size like clothing items, enter whatever you want, like XL, Small, or 32 Inches. Then pick a status: in use, in stock, or broken. Then press the + button or the - button to add or subtract from the quantity of the item you are adding. Or you can click on the number in between the + and - buttons and type a number in manually. This is so that more general and bulk items, such as ribbons or E3 ranks, can be added in bulk, and you can say '25 Petty Officer 3rd Class Ranks.' Then, if you want to add a custom description or note, or anything to an item type what you please in the Description/Notes field. Then press Add Item to finish and add your entry to the data set. Or press Reset to clear the entire data entry panel if you want to start over.

#### Usage Recommendations:

We recommend that after every change you make, you export and store, and keep track of all versions of your data sets through exported JSON files. This way, you can revert to old ones or prevent loss of data that is not backed up. Also, while JSON files import/export don't have storage limits, browsers do. Because temporary

data on this application utilizes the localStorage API it can maximum store 5-10 MB of storage for the application per browser/device it's on. So you can have around 15-20 thousand individual data entries (this doesn't include quantity numbers, because even if you have 25 qty, it still only counts as 1 data entry). But if you back up your data with a JSON, import is, edit as desired, then export again you can have unlimited storage.
